1 Measures

1.1 Cosine Distance

$$cs(P,Q) = \frac{\sum_{i=1}^{n} p_i q_i}{\sqrt{\sum_{i=1}^{n} p_i^2 \sum_{i=1}^{n} q_i^2}} \tag{1}$$

$$cd(P,Q) = 1 - cs(P,Q) \tag{2}$$

1.2 Kullback-Leibler Divergence

$$kl(P,Q) = \sum_{i=1}^{n} p_i \ln\left(\frac{p_i}{q_i}\right) \tag{3}$$

1.3 Mean Kullback-Leibler Distance

$$mkl(P,Q) = \frac{kl(P,Q) * kl(Q,P)}{2} \tag{4}$$

1.4 Symmetric Kullback-Leibler Distance

$$skl(P,Q) = \sum_{n=1}^{n} (p_i - q_i) * \ln\left(\frac{p_i}{q_i}\right) \tag{5}$$

1.5 Jensen Difference Divergence

$$j(P,Q) = \sum_{i=1}^{n} \frac{p_i \ln(p_i) + q_i \ln(q_i)}{2} - \frac{p_i + q_i}{2} * \ln\left(\frac{p_i + q_i}{2}\right) \tag{6}$$

2 N-gram model

2.1 Additive Smoothing

$$p_\lambda(x_i) = \frac{|x_i| + \lambda}{|X| * \lambda N} \tag{7}$$

In Equitation 7 is $p_\lambda(x_i)$ the probabiloty of n-gram x_i in model m. $|x_i|$ is the number of occurrences of x_i in m and $|N|$ the absolute number of all n-grams in m. Finally, N represents the number of *unique* n-grams in m.
